Collection activity

To explain the concept of "addition" to an elementary school child without using the word "plus" or the "+" sign, you can describe it as putting things together or combining groups to find out how many there are in total. As for the physical tool to use, you can prefer small objects like blocks, coins, or beads to make it easier for the child to visualize and count the groups as they combine them.

Activity for comparing lengths.

Let's assume you will study length comparison tomorrow. What "non-standard" measurement units will you bring to class (such as paperclips, pens, etc.)? And why do we use them before the ruler?

Data representation activity

Why is data representation considered an essential skill that students should learn from elementary school, or what benefits will a child gain from this skill in their daily life?
